Introduction to Scientific Visualization

What is Scientific Visualization?

In 1987,

- the National Science Foundation (of the U.S.) started "Visualization in scientific computing" as a new discipline,
- and a panel of the ACM coined the term "scientific visualization"

Scientific visualization, briefly defined:

- The use of computer graphics for the analysis and presentation of computed or measured scientific data.

Conferences and Journals

Conferences

- IEEE Visualization: <http://vis.computer.org>
- EuroVis: <http://www.eurovis.org>

Journals:

- Transactions on Visualization and Computer Graphics
digital library access from ETH: <http://ieeexplore.ieee.org>

SciVis is interdisciplinary

Fields of application include engineering, natural + medical sciences.

Video credit: B. Jobard, CSCS Manno

Types of data

Common to all application fields: **numerical datasets**, providing an abstraction from the particular application.

Characteristics of datasets:

- dimension of domain: number of coordinates or parameters
- dimension of values: scalar, vector, tensor
- discrete vs. discretized data
- type of discretization: (un-)structured grid, scattered data, ...
- static vs. time-dependent

SciVis and InfoVis

Scientific visualization is mostly concerned with:

- 2, 3, 4 dimensional, spatial or spatio-temporal data
- discretized data

Information visualization focuses on:

- high-dimensional, abstract data
- discrete data
- financial, statistical, etc.
- visualization of large trees, networks, graphs
- data mining: finding patterns, clusters, voids, outliers

Preview of topics

5 – Vector Field Visualization

- Vector fields and ODEs
- Streamlines, streaklines, pathlines
- Point location methods
- Streamsurfaces

Ronald Peikert

SciVis 2007 - Introduction

1-11

Preview of topics

6 – Texture Advection

- Line integral convolution
- Lagrangian-Eulerian advection
- Image-Based Flow Vis

Video credit: R. Laramée, TU Wien

Ronald Peikert

SciVis 2007 - Introduction

1-12

7 – Feature Extraction

- Feature classification
- Height ridges/valleys
- Vortex core lines
- Flow separation lines
- Feature tracking

8 – Vector Field Topology

- Critical points and periodic orbits
- Visualization algorithms
- Topological skeletons in 2D
- Topology of 3D vector fields
- Chaotic attractors

9 – Tensor Field Visualization

- Tensors
- Tensor glyphs
- Tensor line tracking
- Topology of tensor fields

Video credit: J. Blaas, Delft Univ. of Tech.

10 – Information Visualization

- Parallel coordinates
- Clustering methods
- Focus+context techniques
- Linked views

Video credit: F. van Ham, TU Eindhoven

11 – Visualization Systems

- Application Visualization System
- VTK/Paraview
- Covise

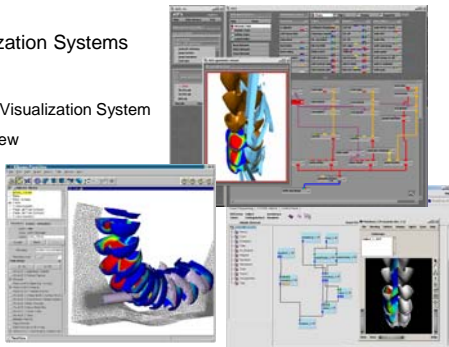

Image credit: J. Favre, CSCS Manno.

12 – Hot Topics in Visualization

- Illustrative visualization
- Multiscale, multiresolution methods
- Uncertainty visualization
- Out-of-core algorithms

Video credit: S. Bruckner, TU Wien

Data discretizations

Types of data sources have typical types of discretizations:

- Measurement data:
 - typically scattered (no grid)
- Numerical simulation data:
 - structured, block-structured, unstructured grids
 - adaptively refined meshes
 - multi-zone grids with relative motion
 - etc.
- Imaging methods:
 - uniform grids
- Mathematical functions:
 - uniform/adaptive sampling on demand

Ronald Peikert

SciVis 2007 - Introduction

1-19

Unstructured grids

2D unstructured grids:

- cells are **triangles** and/or **quadrangles**
- domain can be a surface embedded in 3-space (distinguish n-dimensional from n-space)

Ronald Peikert

SciVis 2007 - Introduction

1-20

Unstructured grids

3D unstructured grids:

- cells are **tetrahedra** or **hexahedra**
- mixed grids (“zoo meshes”) require additional types: **wedge** (3-sided prism), and **pyramid** (4-sided)

Ronald Peikert

SciVis 2007 - Introduction

1-21

Structured grids

General case: **curvilinear grid**

- nodes given in array $N_i \times N_j \times N_k$
- cells are **implicite**

Special case: **rectilinear grid**

- simpler coordinate functions:
 $x = x(i), y = y(j), z = z(k)$

More special: **uniform grid**

- coordinates defined by axis-aligned bounding box (2 points)

Ronald Peikert

SciVis 2007 - Introduction

1-22

Scattered data

Scattered data means: only nodes, no cells

Typical data sources: measurement data, e.g. meteorological

Options for visualization:

- **point-based methods** (relatively few algorithms)
- **triangulation**, e.g. constrained Delaunay, difficult in 3D
- **resampling** on uniform grid

Ronald Peikert

SciVis 2007 - Introduction

1-23

Elementary visualization methods

Scalar fields can be visualized by plotting its **function graphs**:

- 1D field: graph is a curve $y = f(x)$
- 2D field: graph is a **height field** $z = f(x, y)$

Easy for rectilinear grids:

Painter's algorithm (hidden surface removal in software):

- Draw cells row by row, from back to front

Ronald Peikert

SciVis 2007 - Introduction

1-24

Elementary visualization methods

Visualization by **color coding**:

Use: **1D texture mapping!**

```
glTexEnvi(GL_TEXTURE_ENV, GL_TEXTURE_ENV_MODE, GL_MODULATE);  
glTexParameterf(GL_TEXTURE_1D, GL_TEXTURE_WRAP_S, GL_CLAMP);
```

Don't use: **vertex colors** + Gouraud shading!

- Problem of RGB mode:
interpolation in wrong space (RGB vs. color bar)
- Problem of color index mode:
lighting not possible

Elementary visualization methods

1D textures

vertex colors

Elementary visualization methods

Transparent border color

```
glTexParameterf(GL_TEXTURE_1D, GL_TEXTURE_BORDER_COLOR, transp);
```

Example:
vorticity magnitude
on horizontal slices,
high values only

Elementary visualization methods

Example: von Kármán vortex street, colored by entropy
